Process name:	Premium Tool Request Automation	Platform:	Power Automate
Type:	Learning Project / PoC	Domain:	Approval workflow
Author:	María José Jiménez	Status:	Not implemented in production

Problem	Requesting premium tools (AI, design, productivity) was a scattered process handled over email and chat, with informal approvals and no record of who requested what or who approved it.																																								
Description	Flow that receives premium tool requests from a form, routes them to an approver, and notifies the requester of the outcome.																																								
Purpose	Replace informal email/chat requests with a single, traceable, auditable approval process.																																								
Architecture	Microsoft Forms request form → Power Automate orchestration, 5 steps → Approvals Approve / Reject → Condition True / False branch → Outlook outcome email																																								
Workflow (step by step)	<table><thead><tr><th>#</th><th>STEP</th><th>TYPE</th><th>WHAT IT DOES</th><th>RECEIVES → RETURNS</th><th>WHY IT IS NEEDED</th></tr></thead><tbody><tr><td>1</td><td>When a new response is submitted</td><td>Forms trigger</td><td>Starts the flow when the form is submitted.</td><td>— → the flow starts running</td><td>Removes the need to start the process manually.</td></tr><tr><td>2</td><td>Get response details</td><td>Forms</td><td>Retrieves the data the person entered in the form (name, ID number, tool, reason, cost, duration).</td><td>Response ID → field values</td><td>Step 1 only signals that a new request has arrived; this step is what retrieves that request's information so it can be used in the following steps.</td></tr><tr><td>3</td><td>Start and wait for an approval</td><td>Approvals</td><td>Sends the approval card with the request data and holds the flow until the approver clicks Approve or Reject.</td><td>Field values → decision (Approved / Rejected)</td><td>Turns an informal request into a recorded, auditable decision.</td></tr><tr><td>4</td><td>Condition</td><td>Condition</td><td>Evaluates the approval outcome and routes to the corresponding branch (True or False).</td><td>Decision → selected branch</td><td>This is what decides which of the two emails gets sent: one if approved, another if rejected.</td></tr><tr><td>5</td><td>Send an email (V2)</td><td>Outlook</td><td>Sends the requester an email with the outcome of their request: whether the premium tool was approved or rejected.</td><td>Branch + data → email sent</td><td>This is what lets the requester know their request has been answered.</td></tr></tbody></table>					#	STEP	TYPE	WHAT IT DOES	RECEIVES → RETURNS	WHY IT IS NEEDED	1	When a new response is submitted	Forms trigger	Starts the flow when the form is submitted.	— → the flow starts running	Removes the need to start the process manually.	2	Get response details	Forms	Retrieves the data the person entered in the form (name, ID number, tool, reason, cost, duration).	Response ID → field values	Step 1 only signals that a new request has arrived; this step is what retrieves that request's information so it can be used in the following steps.	3	Start and wait for an approval	Approvals	Sends the approval card with the request data and holds the flow until the approver clicks Approve or Reject.	Field values → decision (Approved / Rejected)	Turns an informal request into a recorded, auditable decision.	4	Condition	Condition	Evaluates the approval outcome and routes to the corresponding branch (True or False).	Decision → selected branch	This is what decides which of the two emails gets sent: one if approved, another if rejected.	5	Send an email (V2)	Outlook	Sends the requester an email with the outcome of their request: whether the premium tool was approved or rejected.	Branch + data → email sent	This is what lets the requester know their request has been answered.
#	STEP	TYPE	WHAT IT DOES	RECEIVES → RETURNS	WHY IT IS NEEDED																																				
1	When a new response is submitted	Forms trigger	Starts the flow when the form is submitted.	— → the flow starts running	Removes the need to start the process manually.																																				
2	Get response details	Forms	Retrieves the data the person entered in the form (name, ID number, tool, reason, cost, duration).	Response ID → field values	Step 1 only signals that a new request has arrived; this step is what retrieves that request's information so it can be used in the following steps.																																				
3	Start and wait for an approval	Approvals	Sends the approval card with the request data and holds the flow until the approver clicks Approve or Reject.	Field values → decision (Approved / Rejected)	Turns an informal request into a recorded, auditable decision.																																				
4	Condition	Condition	Evaluates the approval outcome and routes to the corresponding branch (True or False).	Decision → selected branch	This is what decides which of the two emails gets sent: one if approved, another if rejected.																																				
5	Send an email (V2)	Outlook	Sends the requester an email with the outcome of their request: whether the premium tool was approved or rejected.	Branch + data → email sent	This is what lets the requester know their request has been answered.																																				
Decision logic	Condition based on the Approval outcome → TRUE "Send an email (V2) 1" — approval notice to the requester FALSE "Send an email (V2)" — rejection notice to the requester																																								
Form fields	01 Full name · 02 ID number · 03 Requested tool · 04 Reason for use · 05 Cost and billing area · 06 Usage period																																								
Results and potential impact	The automation centralizes approvals into a single, auditable decision point, replacing informal email or chat approvals and making each request easy to trace. It also reduces response times from days to minutes or hours and eliminates the need to manually follow up on email threads and messages to check on the status of each request.
